Skills

Typescript, Javascript, Reactjs, CSS3, HTML5, MongoDB, ExpressJS, Node.js, TailwindCSS, Firebase

Projects

- 2023 - *Manual web scraper* - I was requested to manually scrape multiple emails on a website and place them on an excel sheet, so I built this basic CLI program to help ease the work where instead of manually scraping each emails I was able to automate it which then outputs them to an excel sheet.
 - 2023 - *Warframe event status cli* - A CLI program to fetch and display the current events of the game in the terminal, I created this so that developers like myself won't need to look up any current events that are occurring in the game on the browser since the terminal is where we spend most of our time.
 - 2023 - *Website time tracker* - Chrome extension that tracks the time a user has spent on a website and counts how many times they have visited it.
 - 2023 - *Vimnotes* - I've created a markdown note-taking app, which is a keyboard oriented approach on taking notes using vim key-mapping, The reason why I made Vimnotes was because I wanted to use a markdown web app that uses vim while I was studying Software Development and I was also curious on how to build one myself.
-

Experience

Freelance

• Dubai

09/2023 - 10/2023

- Scraping emails from other website.
- Building a basic web scraper, saving it into a file and then passing it into the CLI to extract all of the emails and output it into an excel sheet.
